SUMMARY

I design automations that run unattended in production, and I operate them afterwards: a signal-execution pipeline placing real trades on live broker accounts, an LLM agent pipeline with 378,110 logged events, and a subscription lifecycle that bills, invites and expires customers untouched. I direct AI coding assistants to implement what I specify, correct what comes back, and run the result. One rule throughout: the model proposes, deterministic code decides, and nothing fails silently.

EXPERIENCE

Technical Co-founder — ALTAJIR (copybridge.cloud)

Remote · 2026 – Present

- Automated the full trade-signal path: an analyst posts a signal, the system parses and validates it, then executes it across subscriber broker accounts via MetaApi — **913 executions and 110 trades against real capital**.
- Built the pipeline first on **n8n** and iterated it across 22 versions chasing sub-second execution, then replaced it with a purpose-built service once the workflow engine itself proved to be the latency ceiling. Also automated MetaApi account deploy/undeploy around market hours.
- Proved the broker P&L identity to **0.000000** across three live accounts, closing an open correctness question instead of assuming it. Automated daily, monthly and trade-close reporting to Telegram.
- Made deployment safe after a multi-file upload tripped fail2ban and left a half-updated tree in production: single atomic archive, 8 tests that gate every release, automatic backup and a documented rollback.

Automation & Integration Engineer — Freelance

Remote · 2025 – Present

- **Autonomous LLM trading pipeline** — five chained Claude agents (scan, analyse, risk, execute, monitor) on a 30-second cycle, with *six hard rules in code that the model cannot override* and a twelve-layer capital-protection stack. 378,110 events, 3,144 signals and 420 versioned prompts logged, with a loop that regenerates the analyst prompt daily from won and lost setups.
- **Customer-support automation for an education client** (delivered 2026, live) — retrieval-augmented chat on Cloudflare Workers that answers only from the client's own documents, cites its source, and hands off to a human rather than guessing. Passed a 24/24 blocking acceptance gate including four questions designed to make it fail.
- **Subscription lifecycle bot** — Telegram platform automating payment proof, admin approval, one-time channel invite, renewal reminders at three and one day, and automatic removal on expiry. Multi-tenant with encrypted per-tenant credentials; 173 tests including cross-tenant isolation gates.
- **PDF processing API** (own product, live on RapidAPI) — 26 endpoints including Arabic OCR and on-device PII redaction, processed in memory.
- **I ship the interface, not just the pipeline.** The systems above include a three-language operations dashboard (Arabic RTL, English, Malay), a driver PWA, an embeddable chat widget, and a full storefront path — catalogue, pricing rules, offers, coupons, loyalty and checkout.
- Operate one Ubuntu VPS running **8 self-built services** across Docker Compose, PM2 and systemd — 64-day uptime, nginx with 7 TLS certificates, scheduled database backups with retention, and a self-hosted n8n instance.

SELECTED SYSTEMS

- **QuickDrop** — multi-tenant delivery platform automating the path from a WhatsApp message to a dispatched rider: order capture, priced quote, payment, automatic dispatch with expanding offer rounds, geofence-triggered status changes and proof of delivery. 8 background queues; 44,205 LOC; 571 tests.
- **QALB-ECG** — automated 12-lead ECG screening. Calibrated model ensemble at 0.919 macro-AUROC paired with a deterministic rule engine, and an out-of-distribution gate that abstains with *"uncertain, refer"* rather than return a confident wrong answer.
- **boq-engine** — turns a room-by-room project into a priced Arabic bill of quantities and a print-ready quotation. Every figure prints its inputs, the formula, and the formula with the values substituted, so a client can argue with the number instead of distrusting it.
- **tenant-guard** and **overfit-stats** — open-source libraries extracted from the systems above: the first makes cross-tenant data leaks impossible to write by accident; the second refuses to certify a trading strategy that is statistically indistinguishable from luck.

SKILLS

Automation	n8n (self-hosted), webhooks, schedulers and cron, queue workers (BullMQ, APScheduler), retries and idempotency
AI / LLM	Claude API, multi-agent pipelines with deterministic guardrails, retrieval with citation grounding, prompt versioning and acceptance gates, PyTorch
Integrations	Telegram Bot API, WhatsApp Cloud API, MetaApi, Supabase, Stripe and Billplz, RapidAPI
Building	Python, TypeScript, SQL, FastAPI, NestJS, Node
Web	React 19, Next.js, Vite, Tailwind, PWA, Arabic RTL and bidirectional i18n, catalogue and checkout flows, landing pages
Data	PostgreSQL, Redis, SQLite, Cloudflare D1, migrations, scheduled backup and restore testing
Operations	Ubuntu, Docker Compose, nginx, systemd, PM2, GitHub Actions, Cloudflare Workers
Spoken	Arabic (native), English (professional working proficiency)
